Attachment to Advisory Action

Applicant's arguments regarding the rejections presented in the June 7, 2005 office action have been considered but are not persuasive. The 35 U.S.C. 112 first paragraph rejection is maintained. No steps are listed in the claims that would enable a person of ordinary skill in the art to use the invention commensurate in scope with these claims, nor has means + function language been used which would direct attention to the specification for interpretation.

Page 2

The 35 U.S.C. 112, second paragraph rejection is maintained. There are no antecedent bases for the limitations of "0.2 % oxygen removal" or "avoidance of magnetite formation" in the claims.

The 35 USC § 103 rejection is maintained. Applicant discloses a pathway on Figure 2 wherein no reduction occurs in the first stage reaction (designated 1 with an opened square symbol on the figure). The pathway shown on Figure 2 indicates that in the 1st stage reactor, the CO and H₂ contents are 0% by volume. If the content of CO and H₂ exceed 0%, the process would be operating within a region where magnetite is thermodynamically stable according to Fig. 2. Applicant does not claim a process where there is 0% H₂ and CO in the "reducing gas", nor would a person of ordinary skill in the art interpret the term "reducing gas" to be a gas containing 0% H₂ and CO. It is therefore not clear that the claims limit the process to correspond with the pathway shown on Fig. 2, or that the invention differs from that disclosed by prior art inventions wherein some reduction occurs in the first reaction stage.
